

Defect Report - Tichi

Defect ID	BUG-TICHI-SIGNUP-001	Reported Date	July 3, 2026
Defect Title	Signup form is not submitted when Enter key is pressed	Reported By	Akashshankar
Module	Signup	Feature	Form Submission Behavior
Related Test Case	TC_SU_042	Status	Open
Severity	Medium	Priority	Medium
Defect Type	Functional	Reproducibility	Needs Verification

Environment

Application	Tichi (https://tichi-app-webapp-stage.web.app)
Environment	Staging
Browser	Google Chrome Version 126.0
Operating System	Windows 11
Build Version	Not Specified

Description

During execution of test case TC_SU_042, the Signup form was completed with valid data and, instead of clicking the Sign Up button, the tester pressed the Enter key to submit the form. The test case expected the form to be submitted in response to the Enter key, consistent with standard web form behavior. Execution recorded a Fail: the form was not submitted when Enter was pressed. This is considered a defect because it deviates from the documented expected result and from conventional form-submission behavior that users commonly rely on.

Preconditions

- The Signup page is loaded and accessible.
- All Signup form fields have been filled with valid data, as recorded in the test case precondition.

Test Data

Not Specified in Test Execution Report.

Steps to Reproduce

1. Navigate to the Signup page of the Tichi web application.
2. Fill in the Signup form fields with valid data, as specified in the test case precondition ("Form is filled with valid data").
3. Instead of clicking the Sign Up button, place focus within the form and press the Enter key.

4. Observe whether the form is submitted.

Expected Result

As documented in TC_SU_042, the Signup form should be submitted when the Enter key is pressed while valid data has been entered in all fields.

Business Impact

A failure to support Enter-key submission on the Signup form introduces an inconsistency in a core user-facing flow. While the Sign Up button remains a functional alternative, deviation from a widely expected form-interaction pattern can be viewed as a quality gap ahead of a production release.

User Impact

Users who are accustomed to submitting web forms by pressing Enter will find that the Signup form does not respond as expected, which may cause momentary confusion or the perception that the application is unresponsive, until they click the Sign Up button directly.

Possible Root Cause

Assumption: the Signup form or its input fields may not be wrapped in a native HTML <form> element with a submit handler, or a keydown/keypress listener for the Enter key may not be bound to the Sign Up action. This is a possible technical explanation only and has not been confirmed against the application source.

Suggested Fix

Recommend that the development team verify whether the Signup form is implemented using a standard form element with a submit event, and, if not, bind an Enter-key handler on the relevant input fields that triggers the same action as the Sign Up button. QA should retest TC_SU_042 after the fix is applied.

Regression Testing Required

Yes.

Regression Scope

- TC_SU_038 — Click Sign Up while mandatory fields are empty
- TC_SU_039 — Double-click the Sign Up button
- TC_SU_040 — Click the Sign Up button multiple times in quick succession
- TC_SU_043 — Confirm redirection after a successful signup

QA Notes

This defect was identified during a single execution of TC_SU_042 within the Form Submission Behavior scenario group. The test execution report does not record repeated attempts, browser, or environment details for this case. Recommend re-executing the test case across the browsers and environments used for the rest of the Signup suite to confirm reproducibility before final severity is locked in.

Traceability Matrix

Requirement	Failed Test Case	Result	Related Test Cases
Signup form should be submitted via standard triggers, including a button click or the Enter key	TC_SU_042	Fail	TC_SU_038, TC_SU_039, TC_SU_040, TC_SU_043

Final QA Summary

Test case TC_SU_042 failed during execution of the Signup module's Form Submission Behavior scenarios: the form did not submit when the Enter key was pressed, contrary to the documented expected result. Severity and priority are assessed as Medium, since the primary Sign Up button provides a working alternative path to complete signup, but the behavior still represents a deviation from standard form-interaction expectations. It is recommended that this defect be addressed and TC_SU_042 be re-executed, along with the related Form Submission Behavior test cases, before the Signup module is considered ready for production release.
